

# Healthcare

Nathan Seto

2025-04-04

**(3) What is the relationship between health risk concentrations and healthcare market supply?**  
**(goal is to ultimately assess health care supply-side institutional capacities and possible gaps)**

**First pass: calculate correlations between environmental risk variables and health care services/infrastructure (particularly for data series identified as targeting “migrant” health) but others too** Data Required:

- healthcare facilities ✓
- immigrant health centers ✓
- environmental risks ✓
- health problems ✓
- H2-A population ✓

Correlations may be less reliable because I cannot group by county because R won't have enough observations to work with. Also, the states have different sets of health facility data, where some states have more or less recorded types of facilities. I could remove those differing variables, but then the only facility type in common would be hospitals, and I don't want to limit the data so much. When calculating correlations, I separated data by state, then aggregated all the data sets after calculating the coefficients. Only one correlation with Total H2A Workers was found to be not significant: Critical Access Hospitals in South Dakota.

**## Number of Correlations Not Statistically Significant: 214**

Correlations between the total number of H-2A workers and healthcare facilities.

|        | State        | Variable          | Predictor                           | Correlation | PValue | Significance |
