

Healthcare Facilities and Risk Factors

Nathan Seto

2025-04-06

What is the relationship between health risk concentrations and healthcare market supply?

(Goal is to ultimately assess health care supply-side institutional capacities and possible gaps)

First pass: calculate correlations between environmental risk variables and health care services/infrastructure (particularly for data series identified as targeting “migrant” health) but others too

Exploration

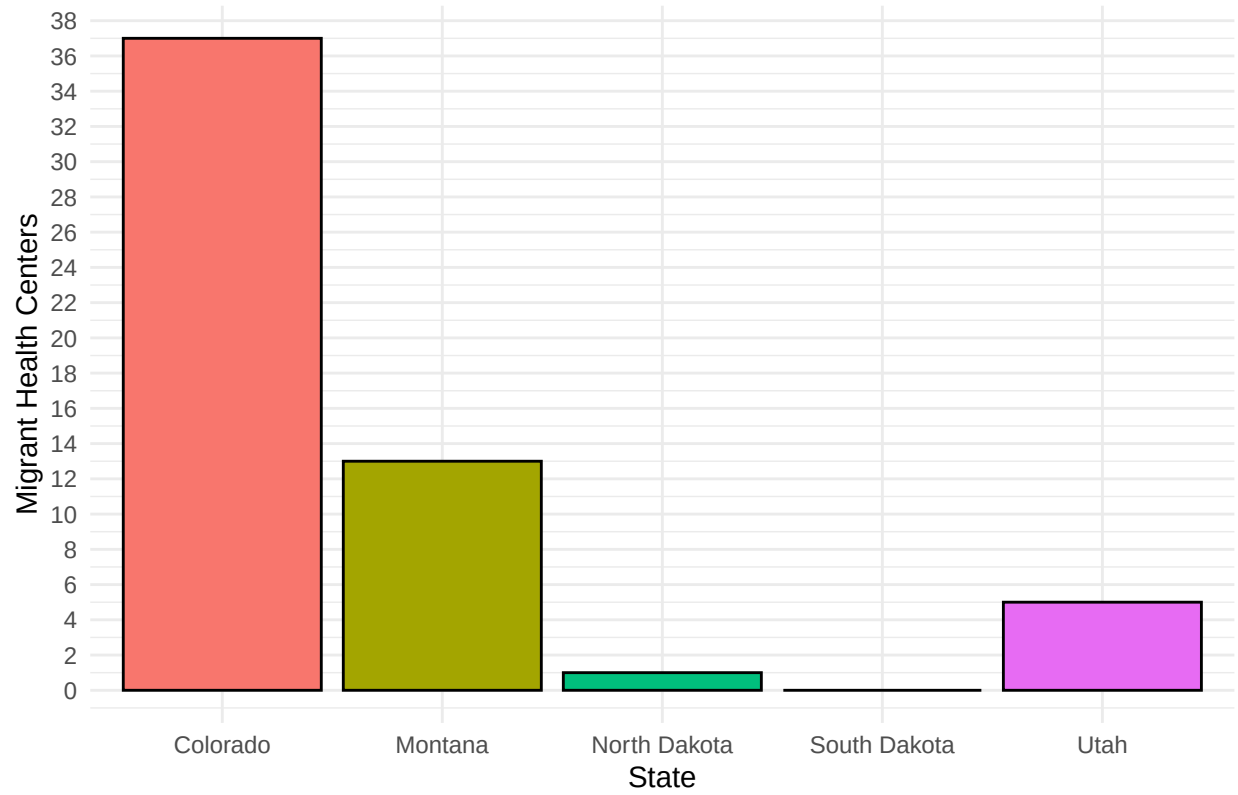

Counts of health facilities labeled as migrant health centers, according to the National Center for Farmworker Health (2023).

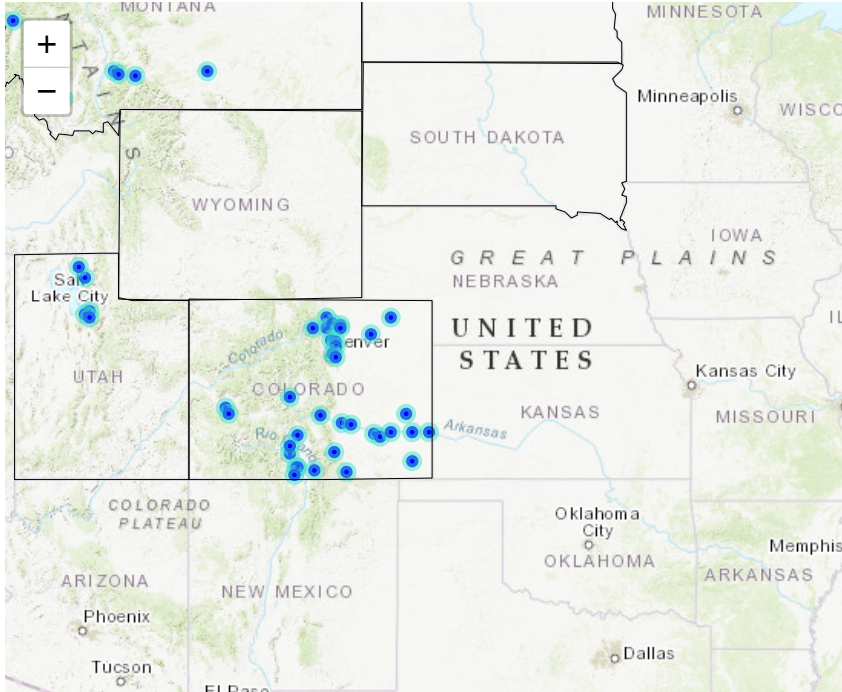

An option to export the data to a .csv was not found, so a data set was manually created by investigating each point within the HICAHS states. During the creation of the .csv used in my analysis, some facilities were found to be permanently closed. They have subsequently been excluded from the file.

It must be kept in mind that some facilities in this list are mobile vans or seasonal locations, and three are purely administrative buildings.

Given current knowledge, Wyoming and South Dakota have no facilities labeled as migrant health centers.

Migrant Health Centers Per State (NCFH)

Correlations Between the Total Number of H-2A workers and Healthcare Facilities.

Each state has different sets of health facility data, where some states have more or less recorded types of facilities. Utah especially has many more categories of healthcare facilities than any other state. I could remove those differing variables, but then the only facility type in common would be hospitals, and I don't want to limit the data to a single type. When calculating correlations, I separated data by state, then aggregated all the data sets after calculating the coefficients. Only one correlation with Total H2A Workers was found to be not significant: Critical Access Hospitals in South Dakota.

State	Variable	Predictor	Correlation	PValue	Significance
Utah	totalworkersh2a	Mammography	0.690	0.00	TRUE
Utah	totalworkersh2a	Hospitals	0.563	0.00	TRUE
